Adaptive Vision Studio 4

intuitive • powerful • adaptable

software for machine vision engineers

Introduction

Adaptive Vision Studio

Adaptive Vision Studio software is the most powerful graphical environment for machine vision engineers. It is based on dataflow and comes with a comprehensive set of powerful, readyfor-use image analysis filters.

Its unique strength lies in its focus on professional users – it allows you to create typical applications easily, but at the same time makes it possible to efficiently develop highly customized and large-scale projects.

Features

Intuitive

All programming is done by choosing filters and connecting them with each other. You can focus all your attention on computer vision.

Powerful

000 1000 effective filters

There are over 1000 ready-for-use machine vision filters tested and improved in hundreds of applications. They have many advanced capabilities such as outlier suppression, subpixel precision or any-shape region-of-interest.

You can see everything

Inspection results are visualized on multiple configurable data previews; and when a parameter in the program is changed, you can see the previews updated in real time.

You can easily create custom graphical user interfaces and thus build the entire machine vision application using a single software package.

Hardware acceleration

The filters are aggressively optimized for the SSE technology and for multicore processors. Our implementations are ones of the fastest in the world.

Loops and conditions

Without writing a single line of code, you can create custom and scalable program flows. Loops, conditions and subprograms (macrofilters) are realized with appropriate data-flow constructs in the graphical way.

Adaptable

GigE vision and GenTL

Adaptive Vision Studio is a GigE Vision compliant product, supports the GenTL interface, as well as a number of vendor-specific APIs. Thus, you can use it with most cameras available on the market.

You can use user filters to integrate your own C/ C++ code with the benefits of visual programming. It takes 30 seconds to build first user filter and 5 seconds to update one after recompilation.

++ C++ and .NET generators

Programs created in Studio can be exported to C++ code or to .NET assemblies. This makes it very easy to integrate your vision algorithms with applications created in C++, C# or VB programming languages.

Workflow

Design the algorithm (1

Creating vision algorithms consists in repeating three intuitive steps:

- Drag & drop filters from the toolbox to the program editor.
- 2 Drag & drop connections between the filters or set constant input values.
- Orag & drop filter outputs to data preview panels for interactive analysis.

The only expertise users need to have is about the core art of computer vision – which filters to connect and how. And yet another great feature of Adaptive Vision Studio is that you can develop this competence quickly through intuitive experimentation.

Create a custom HMI (2

Creating a custom graphical user interface is just as easy:

- Drag & drop controls from the control catalog to the HMI panel.
- 2 Set the controls' properties.
- Drag & drop connections between the filters and the controls.

Note that you can also easily integrate your algorithm with an HMI created in C++ or C#.

When the program is ready, you can export it to a runtime executable and deploy it on a PC-based industrial computer or on a smart camera.

Data Flow Programming

Introduction

Adaptive Vision Studio is a drag and drop environment designed for machine vision professionals. Experience in lowlevel programming is not required. Nevertheless, it is a fully fledged visual programming language and you have to understand its 4 core concepts: Data, Filters, Connections and Macrofilters.

Macrofilters

Macrofilters provide a means for building large real-life programs. They are reusable subprograms with their own inputs and outputs, and as a whole they can be used just as any regular filter. Moreover, macrofilters can perform iterative computations with state registers, thus providing an elegant way to create programs of any complexity.

Data & Filters

Filters are the basic data processing elements in the data flow driven programming. In a typical machine vision application input images are tranformed by a sequence of filters into regions, contours, geometrical primitives and then into final results such as a pass/fail indication. Adaptive Vision Studio also supports data collections (arrays) and filters that store information between consecutive iterations to compute aggregate results.

Connections

Different types of connections between filters support: *basic* flow of data , automatic conversions , for-each processing , and conditional processing . The connection types are inferred automatically on the *do what I mean* basis.

More information can be found on our web page and in the user manual.

Tutorial

Here is a simple example of a data-flow driven program

An image is acquired from a camera:

2 The image is thresholded into a region (a run-length encoded binary image) and then split into connected components:

ClassifyRegions filter analyzes the *elongation* feature of each component:

{ 19.554, 19.433, 3.866, ...}

...and splits the array of regions into arrays of accepted and rejected elements accordingly to the specified range:

5 Finally the bounding circles of the accepted objects are drawn:

Program Editor - Design		→ 무 X				
Main 🕂 IO	- 2 2	$! Q \leftarrow \rightarrow \uparrow \land$				
0 GigEVision Grahimage Synchronous						
		inAddress				
outFrame	GiG	outFrameID				
		outTimestamp				
1. ThresholdToRegion: Intensity						
inImage		inMinValue*

outImage						

Capabilities

Filters

There are over 1000 filters encompassing both basic transforms and specialized machine vision tools.

Image Processing	Camera Calibration ID Profile Analysis		Edge Template Matching
Blob Analysis	Fourier Analysis	1D Measurements	Histogram Analysis
Contour Analysis	Hough Transform	2D Measurements	OCR
Planar Geometry	Barcode Reading	3D Measurements	Deep Learning
Shape Fitting	Data Code Reading	Gray Template Matching	GigE Vision and GenTL

Performance

The filters of Adaptive Vision Studio are highly optimized for modern multicore processors with SSE2 technology. Speedup factors that can be achieved are however highly dependent on the particular operator. Simple pixel-by-pixel transforms after the SSE-based optimizations already reach memory bandwidth limits. On the other hand, more complex filters such as gauss smoothing can achieve even 10 times lower execution times than with C++ optimizations only.

FILTER	AVS 4.10.5	ANOTHER PRODUCT	OPEN LIBRARY
Image negation	0.032 ms	0.03 ms	0.032 ms
Add two images (pixel by pixel)	0.032 ms	0.04 ms	0.028 ms
Image difference (pixel by pixel)	0.031 ms	0.038 ms	0.026 ms
RGB to HSV conversion (3xUINT8)	0.554 ms	0.823 ms	0.562 ms
Gauss filter 3x3	0.032 ms	0.166 ms	0.064 ms
Gauss filter 5x5	0.036 ms	0.168 ms	0.115 ms
Gauss filter 21x21 (std-dev: 4.3)	0.51 ms	1.23 ms	1.979 ms
Mean filter 21x21	0.094 ms	0.092 ms	0.341 ms
Image erosion 3x3	0.032 ms	0.062 ms	0.032 ms
Image erosion 5x5	0.032 ms	0.064 ms	0.045 ms
Sobel gradient amplitude	0.064 ms	0.032 ms	
Sobel gradient amplitude	0.092 ms	0.035 ms	
Threshold to region	0.015 ms	0.014 ms	
Splitting region into blobs	0.024 ms	0.024 ms	
Bilinear image resize	0.017 ms	0.165 ms	0.085 ms

The above results correspond to 640x480 resolution, 1xUINT8 on an Intel Core i5 - 3.2 GHz machine. To assure the most precise results big images were tested and the results were normalized. Note also that the functions from the different libraries do not always produce exactly the same output data.

More than Visual Programming

Large-Scale Projects

One of the most distinguishing features of Adaptive Vision Studio is its applicability for large-scale projects. It has been used to build algorithms composed of hundreds of tools and in systems that required maintenance of many different product versions. Creating such systems is possible due to the feature of modules, hierarchical view of the program structure, version control friendly file format and support for test-driven development.

User Filters

User filters allow C++ programmers to integrate their existing or new code with the benefits of the rapid graphical development. It works with Microsoft Visual C++ (including Express edition).

To add a new user filter click File / Add New Filter to have a sample C++ filter ready and functional in less than 30 seconds. Then on you can work side by side in both enviroments and have your filters automatically reloaded each time you build the C++ project.

Adaptive Vision Library

Adaptive Vision Library is a tool for C++ and .NET programmers available as a single DLL file with appropriate headers. The design is simple – for each filter of Adaptive Vision Studio there is a corresponding function in Adaptive Vision Library with several input and output parameters corresponding to the input and output ports of the filter.

The C++ code or a .NET assembly can also be generated automatically from algorithms created with Adaptive Vision Studio. This creates a unique possibility to create a program in a graphical environment and then compile it to a native Windows executable.

TresholdImage: Intensity

About Adaptive Vision

Adaptive Vision was founded in 2007 as a new brand of Future Processing Sp. z o. o. company. Since then we have been providing machine vision software, libraries and development services. We create effective and userfriendly technology as a reliable partner of machine builders, vision system integrators and industrial end-users.
